Q-SWITCHING LASERS

Journal of the Optical Society of America B
OPTICAL PHYSICS

Excitability in an all-fiber laser with a saturable absorber section

Robert Otupiri,[1,*] Bruno Garbin,[2] Neil G. R. Broderick,[1] and Bernd Krauskopf[3,4]

All optical Q-switched laser based spiking neuron

Keshia Mekemeza-Ona, Baptiste Routier and Benoît Charbonnier*

Université Grenoble-Alpes, CEA, Leti, Grenoble, France

- Optical neural computers
- Excitability
- Self pulsations – like neurons

Optical frequency combs more important, for timing need to know how they return to equilibrium when perturbed
Need phase stability for optical clock, need precision, can't miss a cycle,
Need to study how optical clocks return to equilubrium

Will start with Q switch lasers, but can be applied to others

Communications require high bitrate periodic pulses, if you peturb there will be a changed response

Been well studied in domain of neruo physics, q switch analogue to neurons

More physical terms
How does a perturbed laser return to equilibirum
How does a clock return to equilibrium?

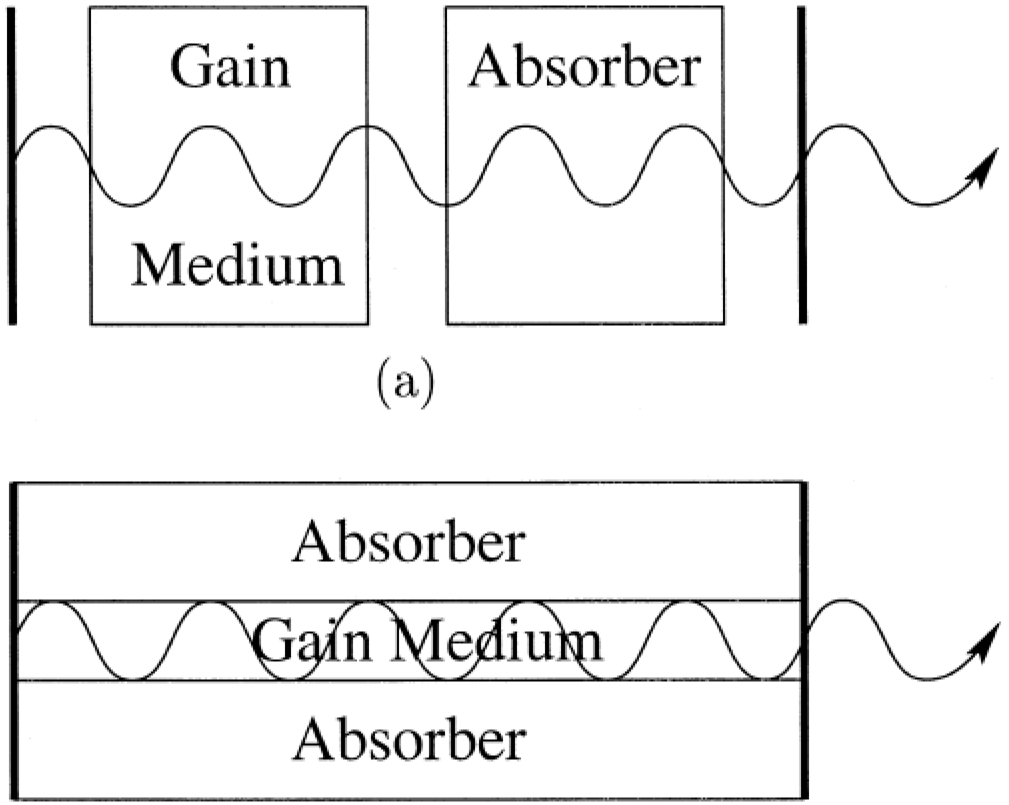
THE YAMADA MODEL

$$\dot{G} = \gamma\,(A - G - G\,I)$$
$$\dot{Q} = \gamma\,(B - Q - a\,Q\,I)$$
$$\dot{I} = (1 - G - Q)\,I$$

- G – Gain
- Q – Absorption
- I – Intensity

Parameters

- γ – Photon loss rate
- A – Pump current to gain
- B – Absorption coefficient
- a – Relative absorption vs. gain

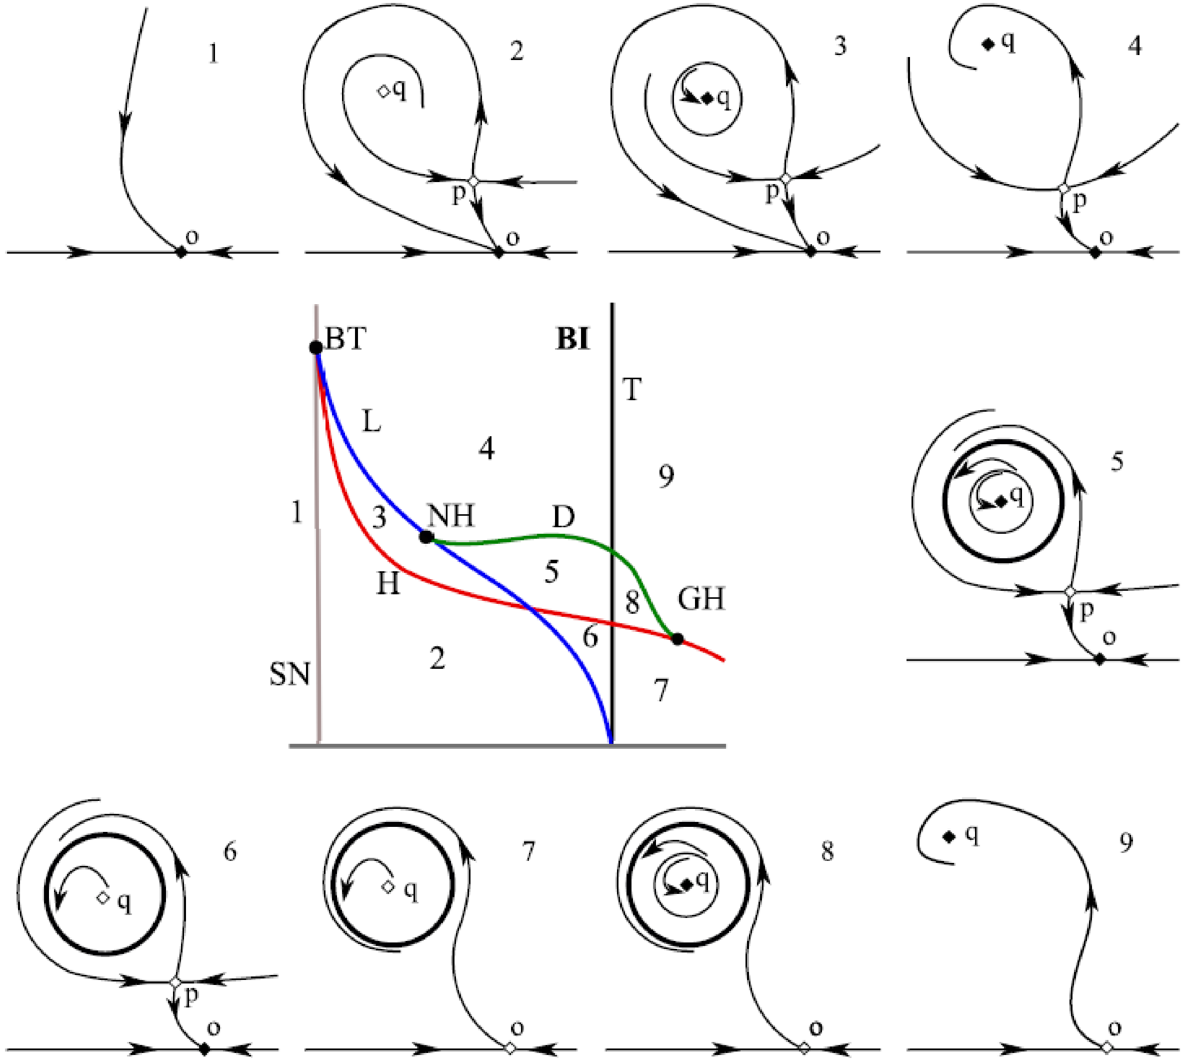


Taken from J. L. A. Dubbeldam and B. Krauskopf *“Self-pulsations of lasers with saturable absorber: Dynamics and bifurcations”*, Opt. Commun., **159** (4-6), 325 (1999).

THE YAMADA MODEL: BIFURCATION DIAGRAM

- Different dynamics split by bifurcations:
  - Hopf, homoclinic, saddle

- Objects in phase space
  - *o* – Stable equilibrium ('off state')
  - *p* – Saddle with two unstable and one stable eigenvalues
  - *q* – Spiral source
  - Attracting periodic orbit
  - Saddle periodic orbit



Taken from R. Otupiri, B. Krauskopf, N. G. R. Broderick *"The Yamada Model for a Self-Pulsing Laser: Bifurcation Structure for Non Identical Decay Times of Gain and Absorber"*, Int. J. Bifurc. Chaos Appl. Sci. Eng., **30** (14) (2020).

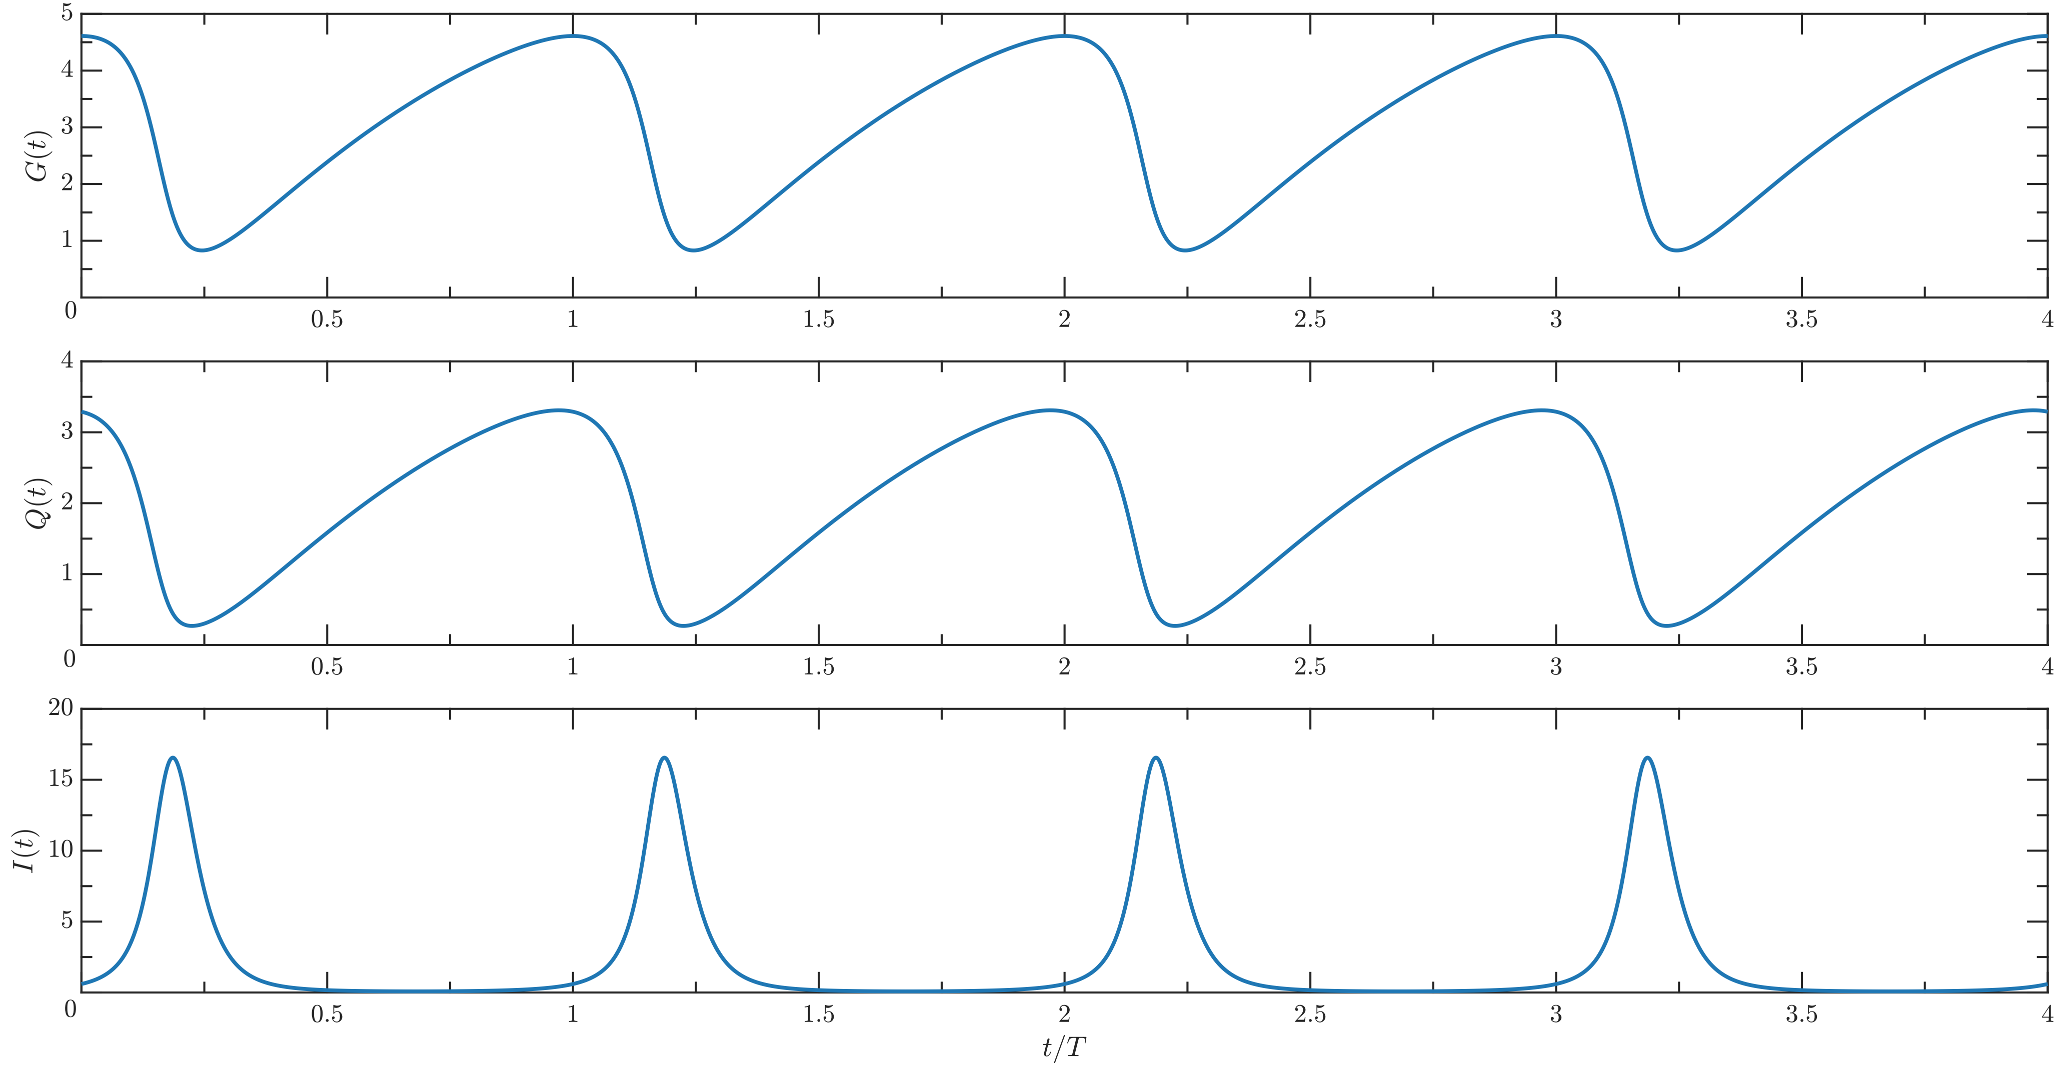
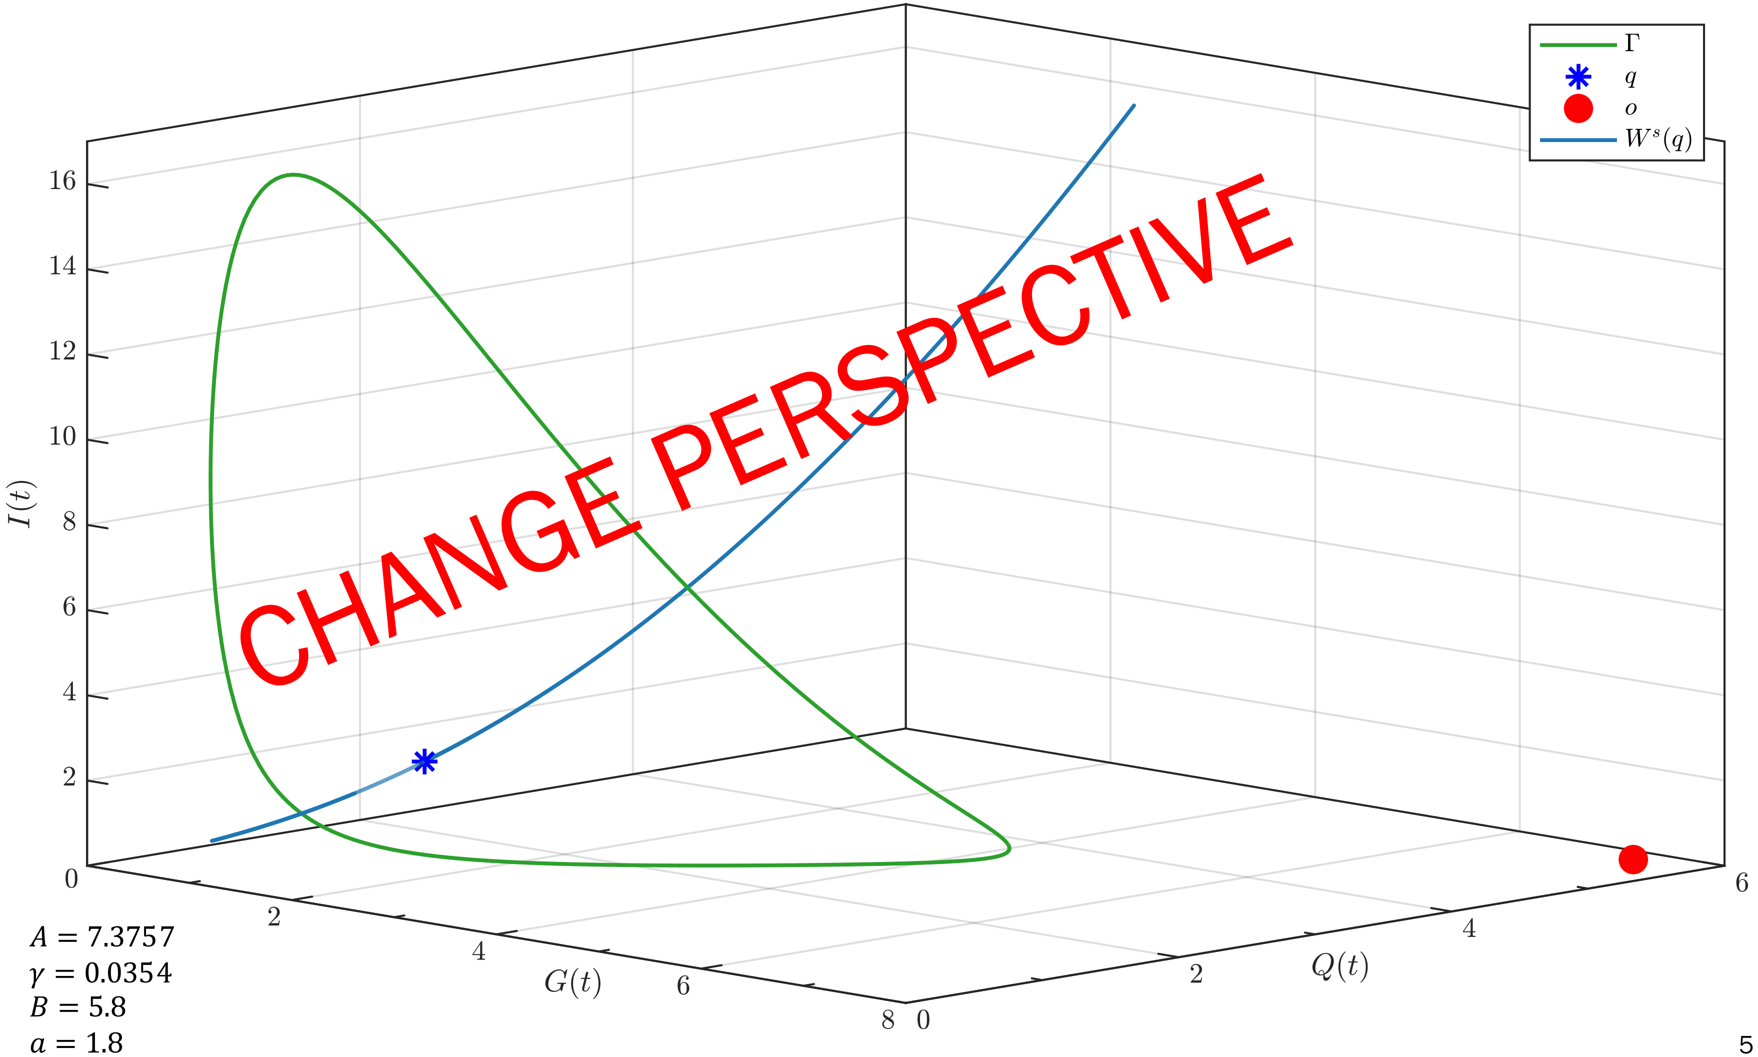
THE YAMADA MODEL: ATTRACTING PERIODIC ORBIT



$A = 7.3757$
$\gamma = 0.0354$
$B = 5.8$
$a = 1.8$

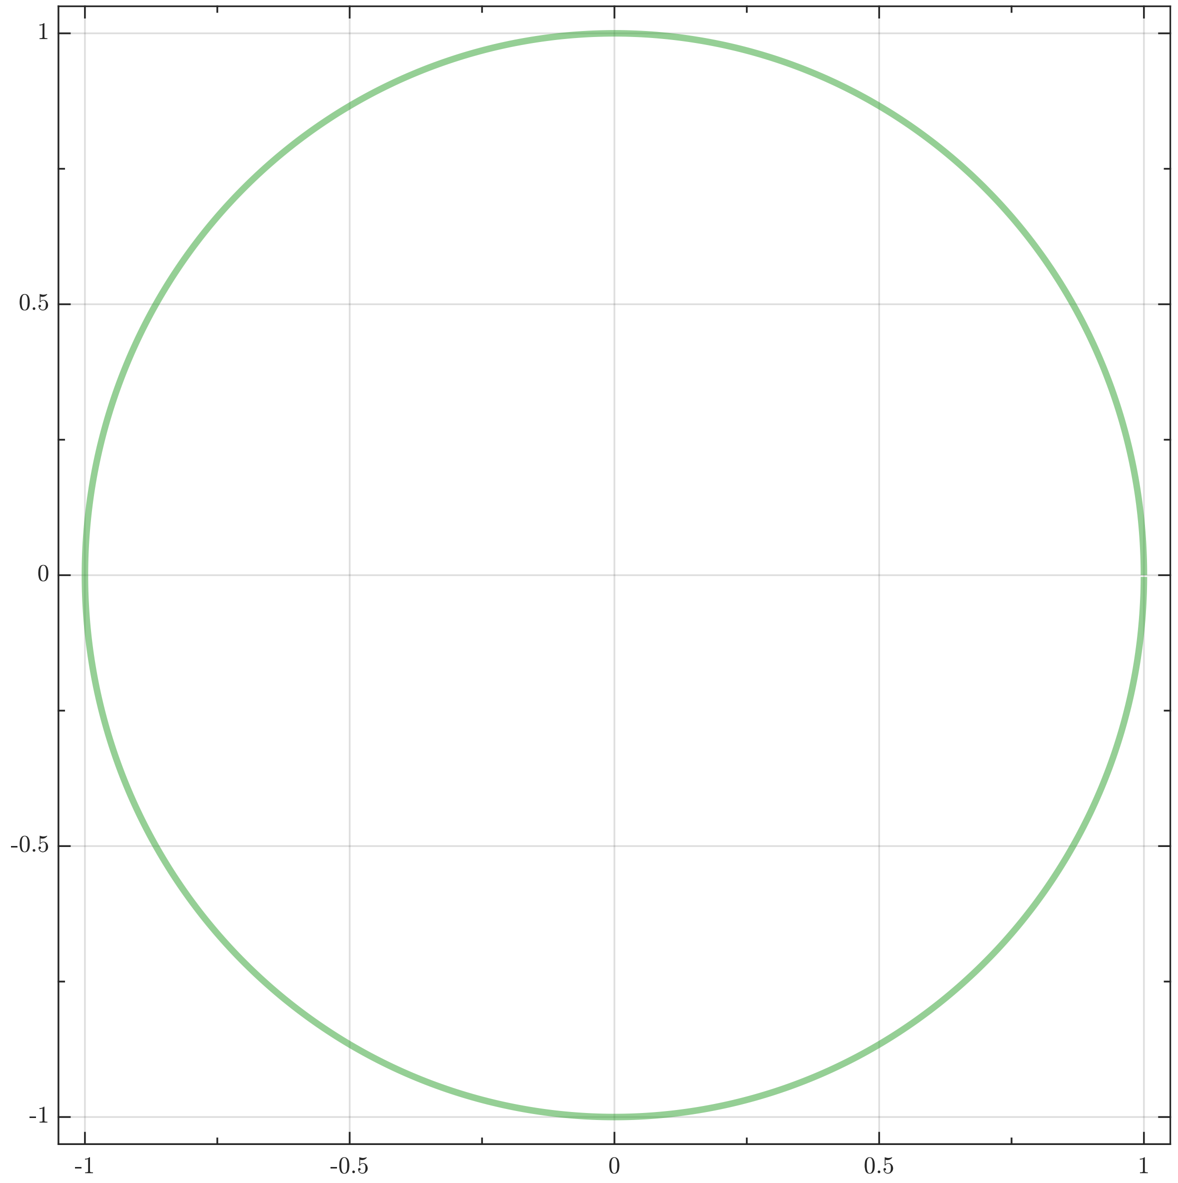
THE YAMADA MODEL: ATTRACTING PERIODIC ORBIT

- Attracting periodic orbit (green)
- "Off" state (red circle)
- Saddle (blue star)
  - 1-D stable manifold (blue)



PHASE-RESETTING

- Induced perturbation
  - A_{p} – amplitude
  - $d_{\mathrm{p}} = \left(\cos\theta_{\mathrm{p}}, \sin\theta_{\mathrm{p}}\right)$ – direction
  - θ_{old} – phase perturbation is applied
- When does the perturbed segment return?
  - θ_{new} – phase perturbation returns
- Boundary value problem (BVP)
  - Numerical continuation in AUTO and COCO



PHASE-RESETTING

- Induced perturbation
  - A_{p} – amplitude
  - $d_{\mathrm{p}} = \left(\cos\theta_{\mathrm{p}}, \sin\theta_{\mathrm{p}}\right)$ – direction

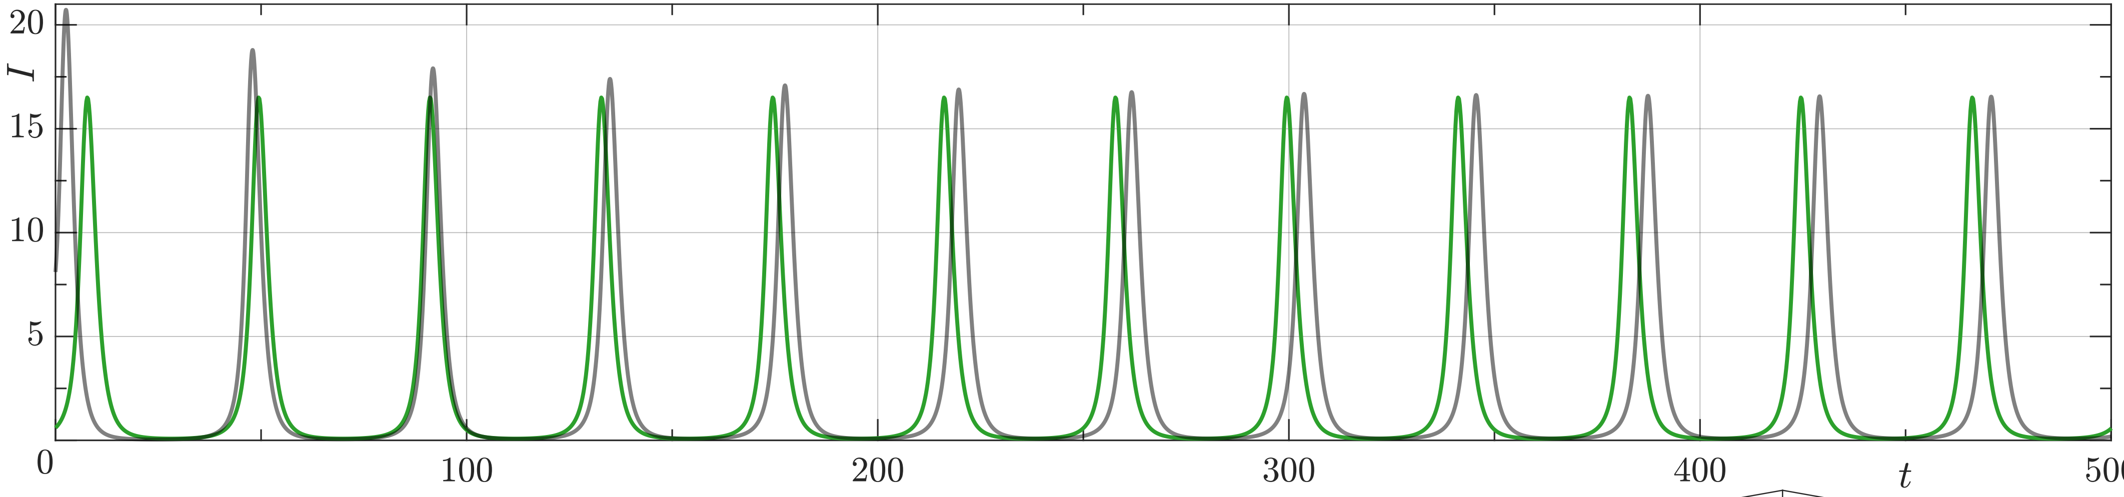
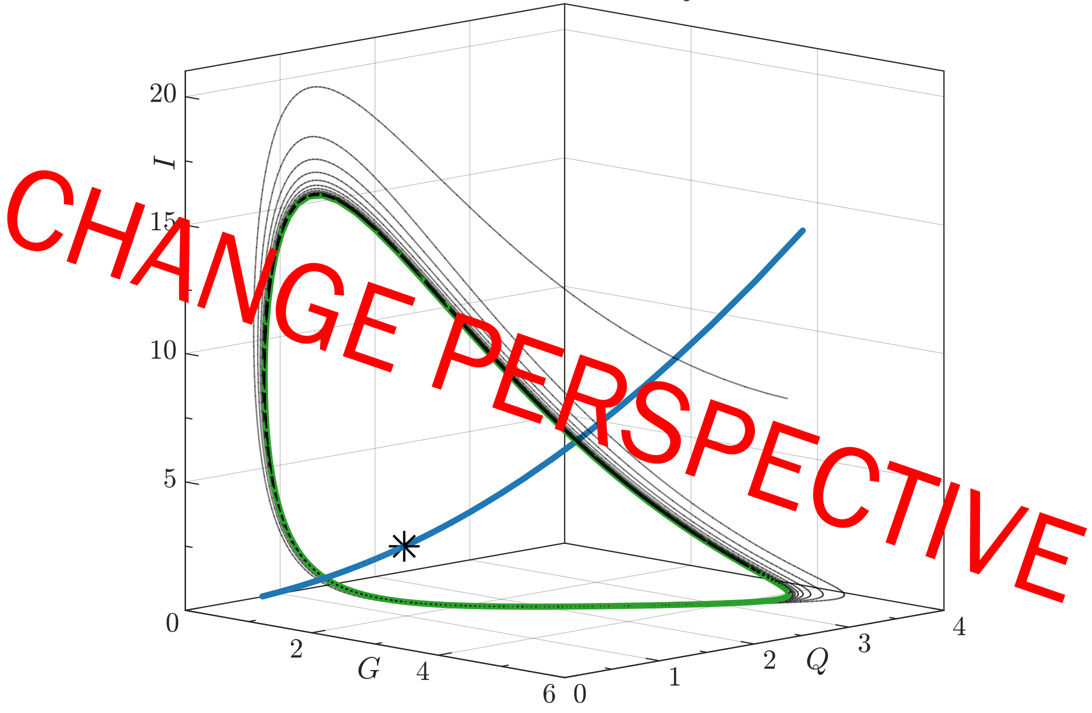
Continuation-based Computation of Global Isochrons*

Hinke M. Osinga† and Jeff Moehlis‡

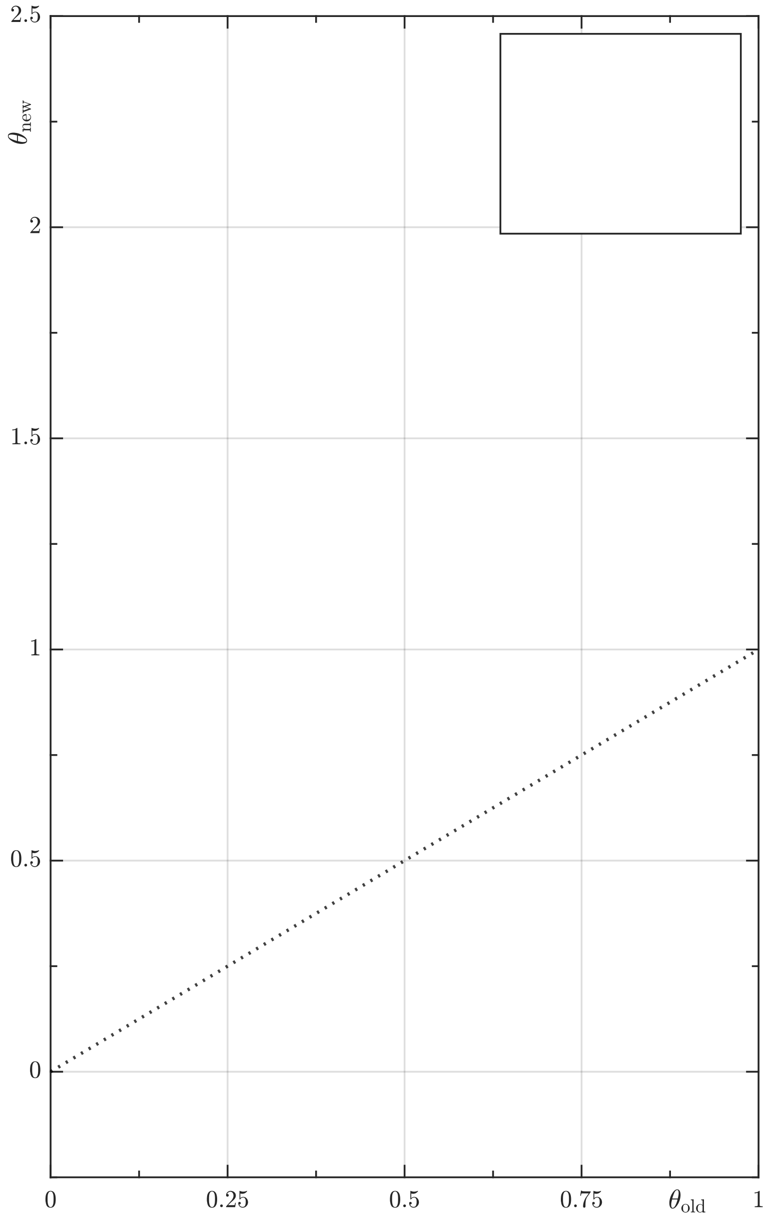
PHASE-RESETTING: YAMADA MODEL



- Perturbations in (*G*-*I*) plane
  - $d_{\mathrm{p}} = (\cos\theta_{\mathrm{p}}, 0, \sin\theta_{\mathrm{p}})$
- Cause a phase shift ('lag') in intensity pulses.
- Relationship between A_{p}, θ_{old}, and θ_{new}?

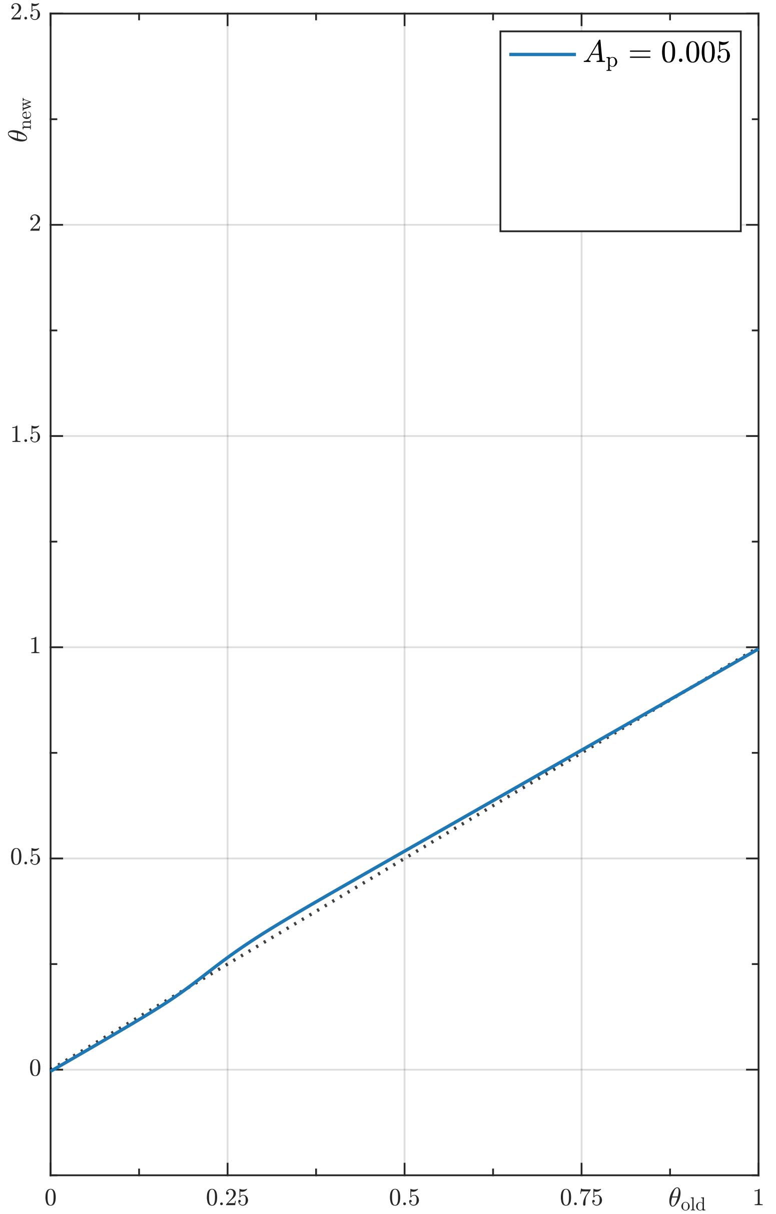


PHASE-TRANSITION CURVES (PTC)

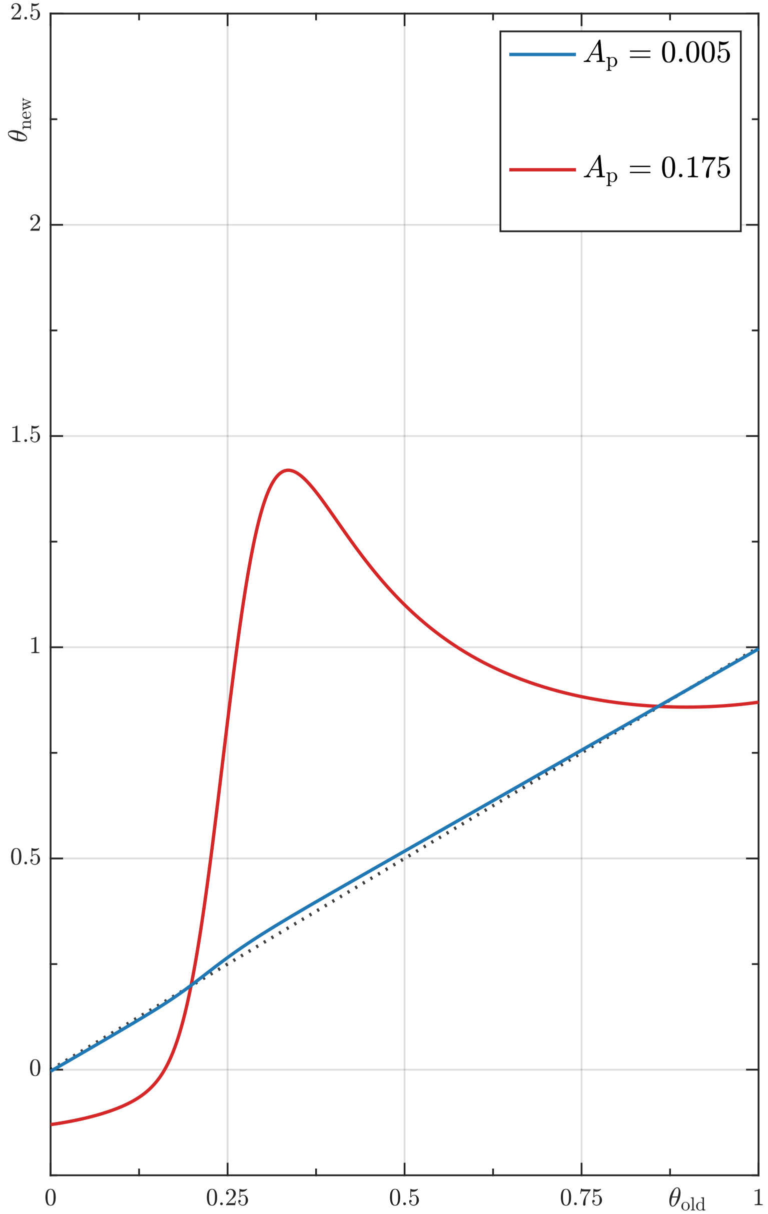


- Positive-*G* perturbations (intensity "kick")
  - $d_{\mathrm{p}} = (0, 0, 1)$
- Weak perturbations "reset" to the same phase
  - $\theta_{\mathrm{p}} \approx \theta_{\mathrm{p}}$
- Stronger perturbations …

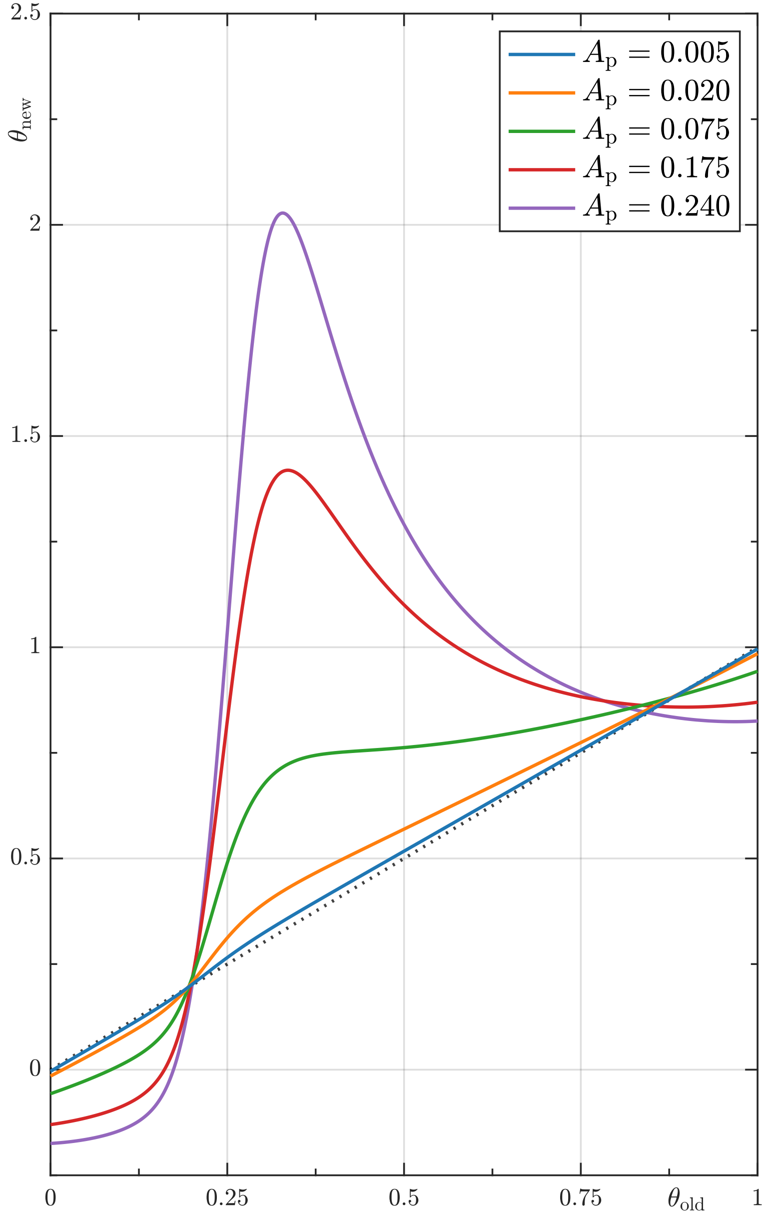
PHASE-TRANSITION CURVES (PTC)



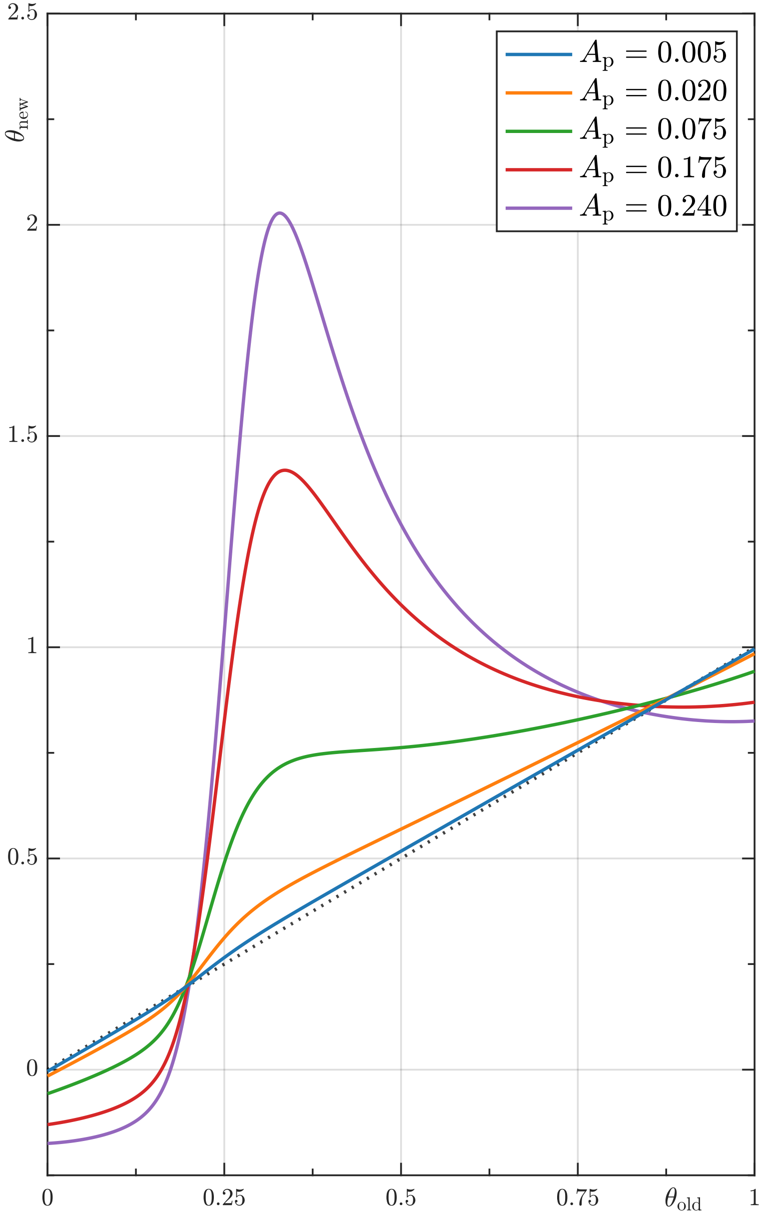
PHASE-TRANSITION CURVES (PTC)

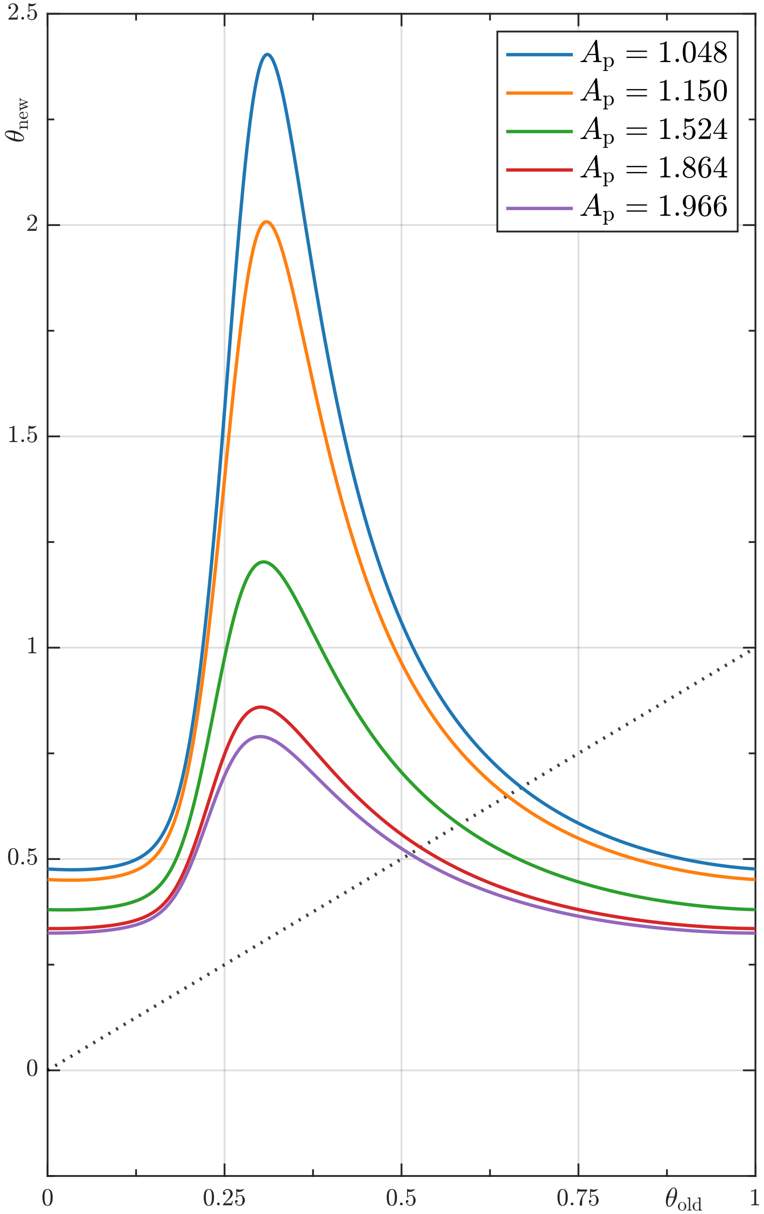


PHASE-TRANSITION CURVES (PTC)



PHASE-TRANSITION CURVES (PTC)





PHASE-TRANSITION CURVES (PTC)

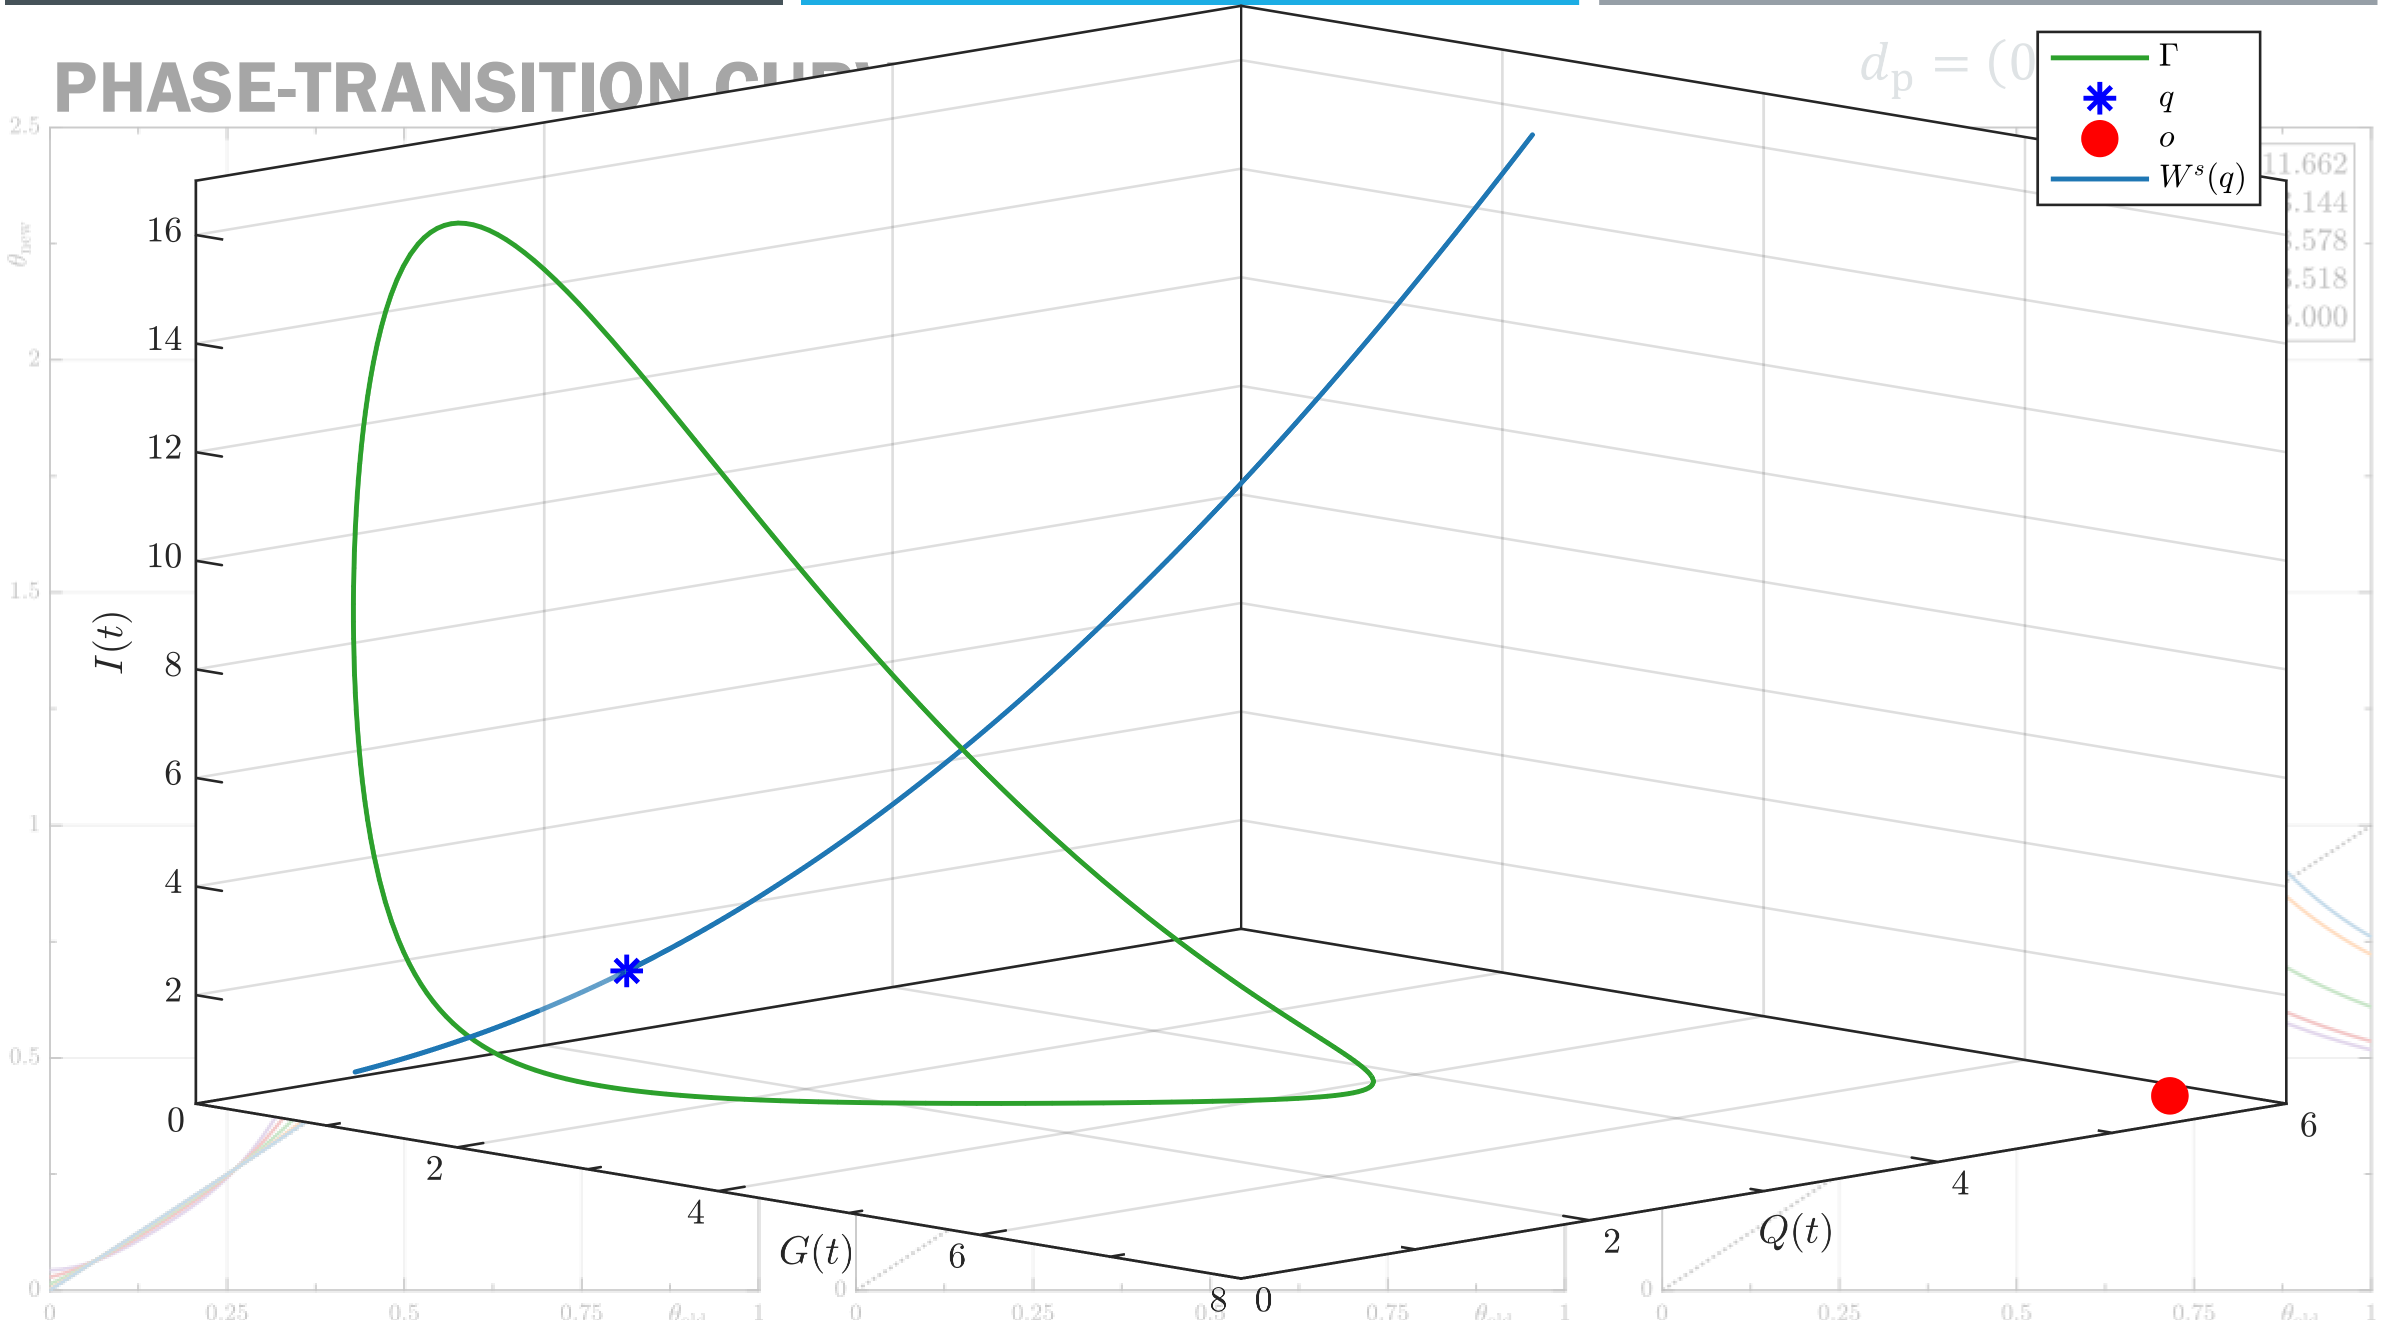
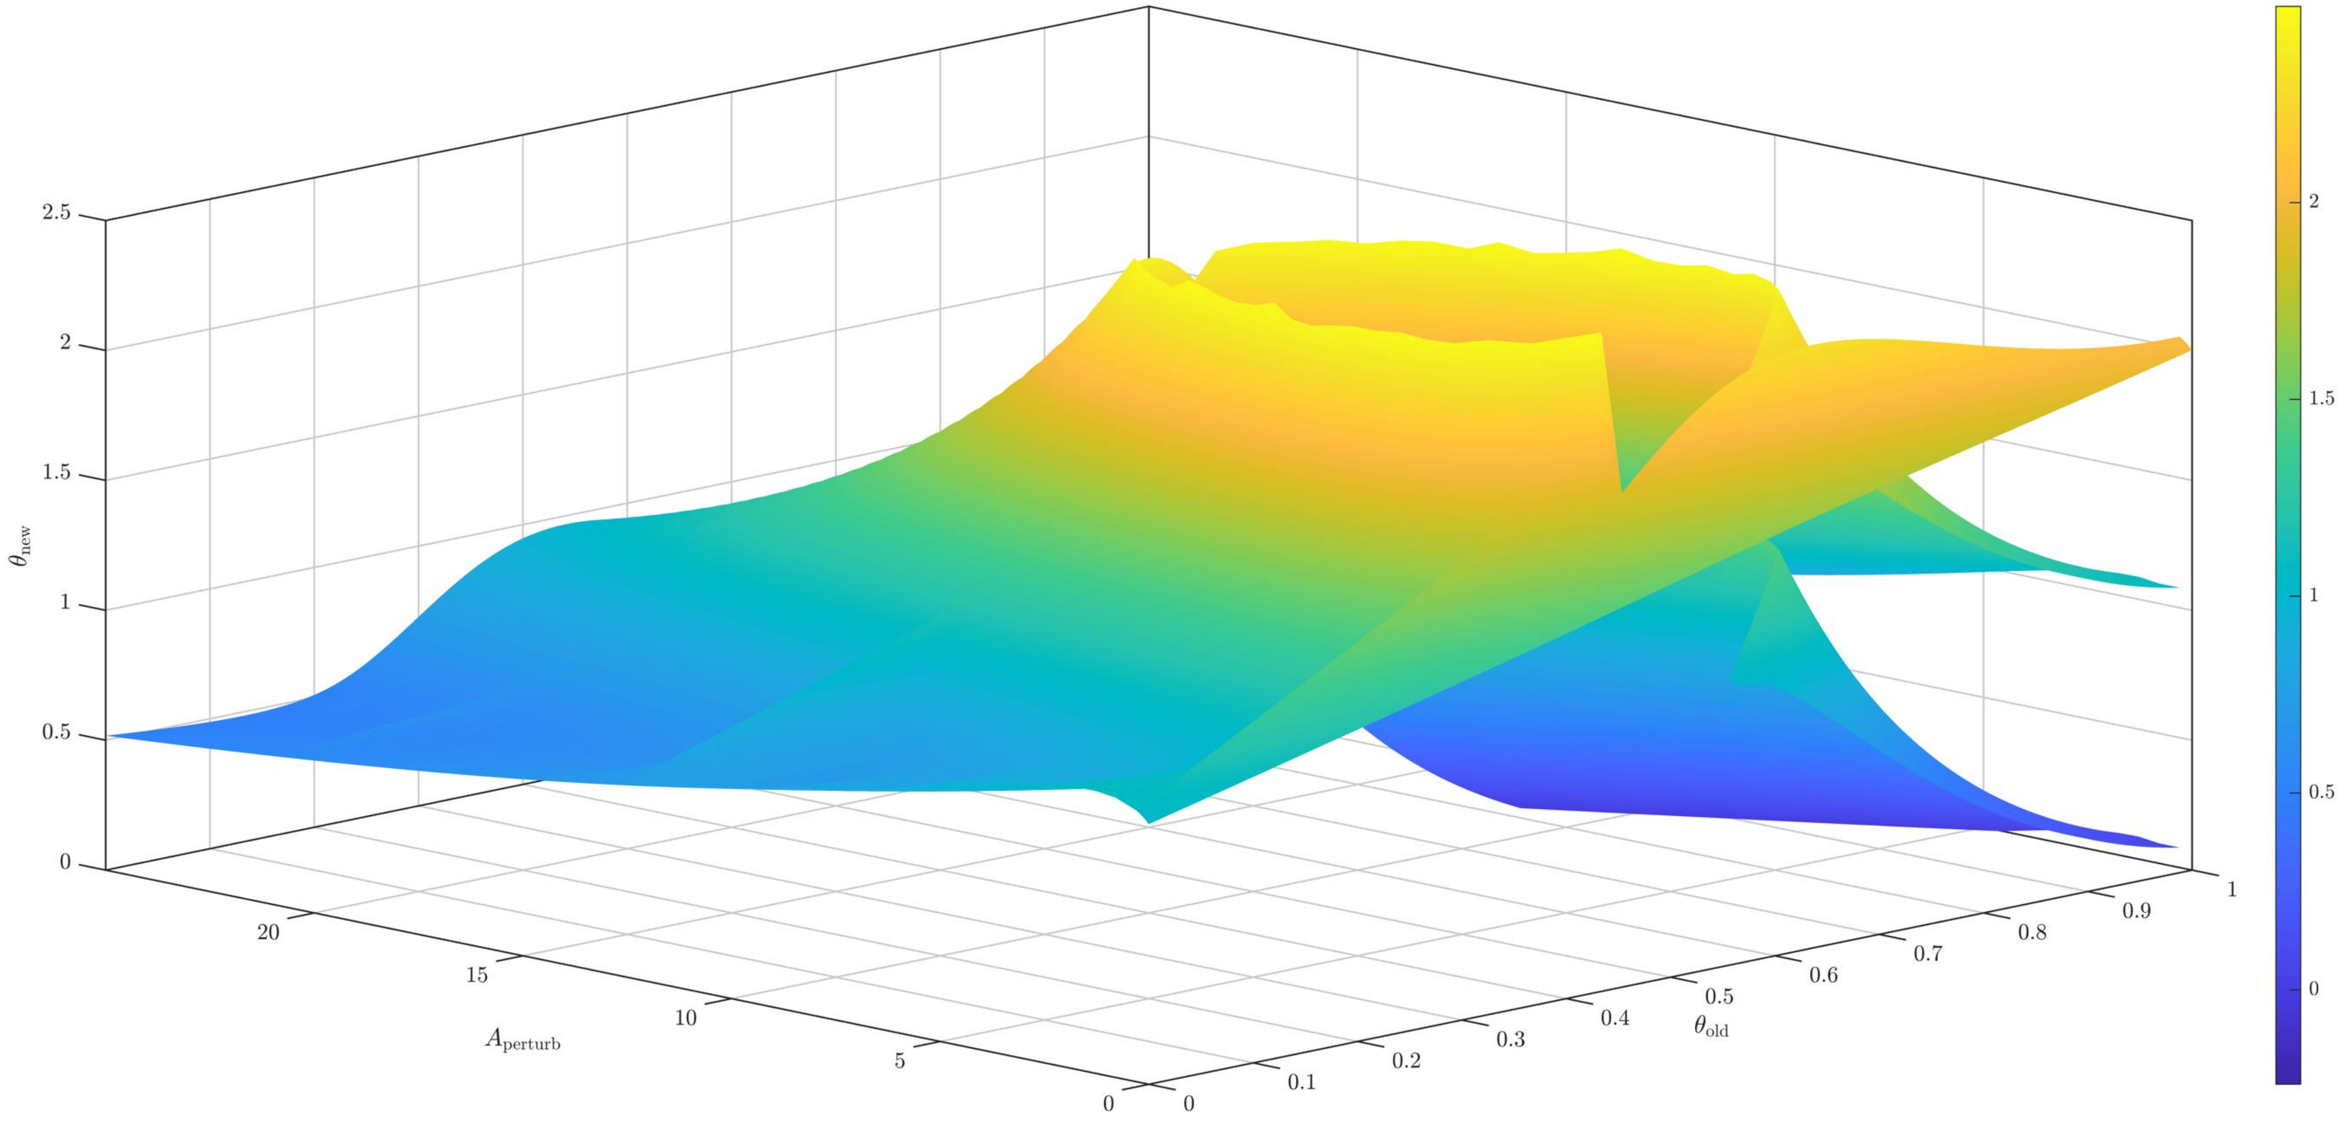
PHASE-TRANSITION CURV



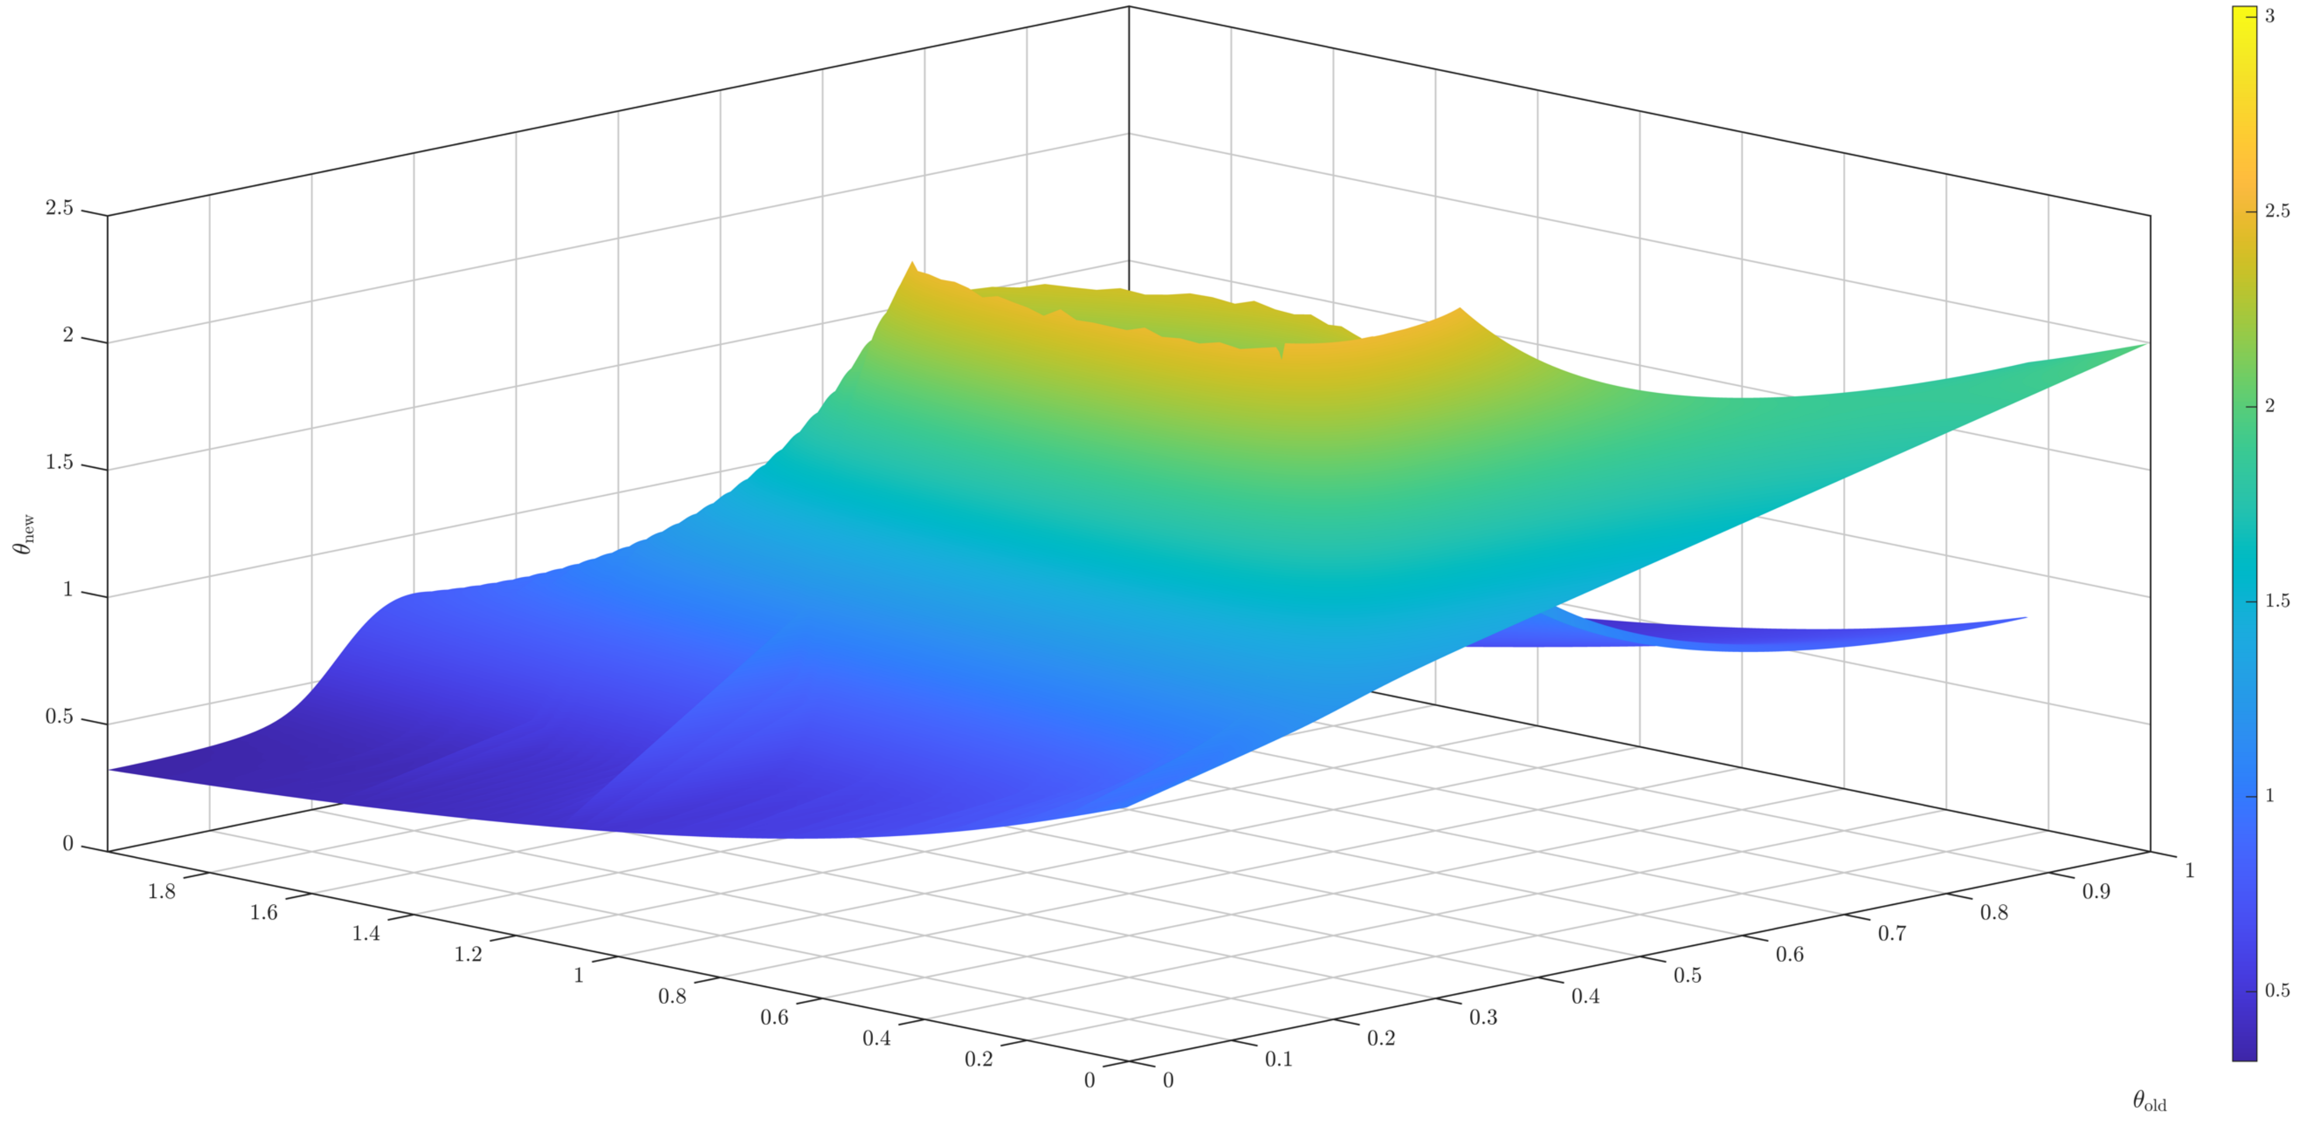
PHASE-TRANSITION CURVES (PTC)

$$d_{\mathrm{p}} = (0, 0, 1)$$

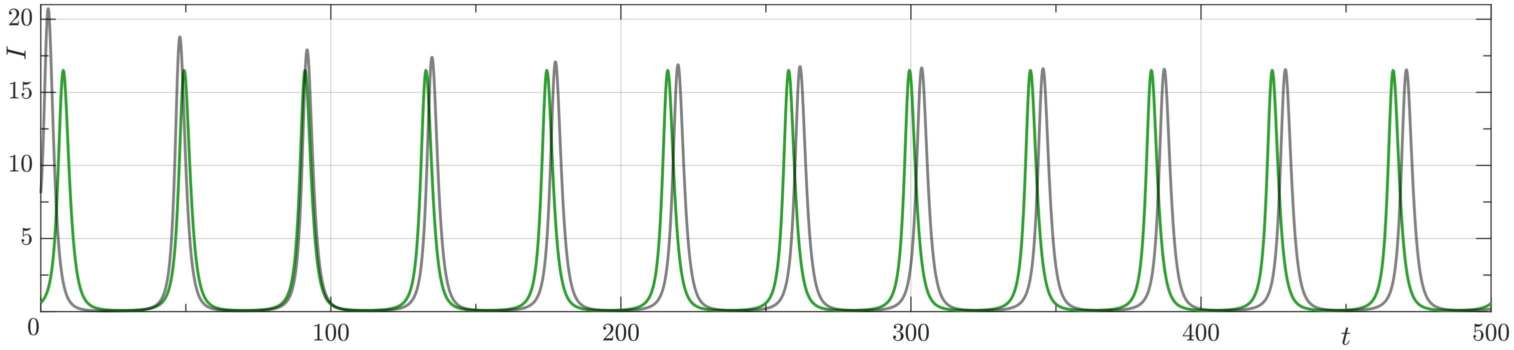


PHASE-TRANSITION CURVES (PTC)

$d_{\mathrm{p}} = (1, 0, 0)$



CONCLUSIONS



- Phase-Resetting is a powerful tool in studying the response of periodic solutions to induced perturbations
- Discontinuities in PTC when perturbation approaches stable manifold of spiral source
- Can technically consider perturbation in any "direction".
- Something else here too…
